# Subleading effects in soft-gluon emission at one-loop in massless QCD

### Czakon, Eschment, Schellenberger, JHEP 12 (2023) 126

## Motivation

- Necessity to include virtual collinear enhancements at higher orders noticed by <u>del Duca</u> (1990)
- Extension to tree-level QCD described in 1404.5551, 1406.6987, 1406.6574
- Why bother (if you don't like pure theory)?

  - can be used to improve numerical stability in cross section calculations

•	At leading power: eikonal approximatio
	you need to calculate a soft current,
?	but at least the structure is understood

• Structure at next-to-leading power understood at tree-level QED by Low (1958), Burnett and Kroll (1968)

• needed to obtain cross sections approximations at subleading power in different kinematic variables

## Structure of the Result

- Several attempts to understand one-loop QCD amplitudes (more results for photon emission):
  - based on SCET: <u>1412.3108</u>, <u>1912.01585</u>, <u>2112.00018</u>
  - based on Feynman-diagram analysis: <u>1503.05156</u>, <u>1610.06842</u>
- Complete characterisation in Czakon, Eschment, Schellenberger, JHEP 12 (2023) 126

Subleading behaviour for squared amplitudes <u>1706.04018</u> - here including the massive case

$$\begin{split} \left\langle M_{g}^{(0)}(\{k_{l}\},q) \middle| M_{g}^{(0)}(\{k_{l}\},q) \right\rangle &= -\sum_{i \neq j} \left( \frac{k_{i} \cdot k_{j}}{(k_{i} \cdot q)(k_{j} \cdot q)} - \frac{m_{i}^{2}}{2(k_{i} \cdot q)^{2}} - \frac{m_{j}^{2}}{2(k_{j} \cdot q)^{2}} \right) \left\langle M^{(0)}(\{k_{l} + \delta_{il}\Delta_{i} + \delta_{jl}\Delta_{j}\}) \middle| \mathbf{T}_{i} \cdot \mathbf{T}_{j} \middle| M^{(0)}(\{k_{l} + \delta_{il}\Delta_{i} + \delta_{jl}\Delta_{i} + \delta_{jl$$

Kinematics satisfies momentum conservation and on-shellness  $\sum_{l} k_{l} + \delta_{il} \Delta_{i} + \delta_{jl} \Delta_{j} = 0, \qquad \left(k_{l} + \delta_{il} \Delta_{i} + \delta_{jl} \Delta_{j}\right)^{2} = m_{l}^{2} + \mathcal{O}(\lambda^{2})$ 

### Importance of proper definition of kinematics (see also 2401.01820) - an expansion requires an expansion parameter !

Extension of soft current to subleading behaviour

$$\mathbf{P}_{g}(\sigma,c) \mathbf{S}^{(1)}(\{p_{i}\},\{\delta_{i}\},q) + \mathcal{O}(\lambda) = \frac{2r_{\text{Soft}}}{\epsilon^{2}} \sum_{i \neq j} if^{abc} \mathbf{T}_{i}^{a} \mathbf{T}_{j}^{b} \otimes \left(-\frac{\mu^{2} s_{ij}^{(\delta)}}{s_{iq}^{(\delta)} s_{jq}^{(\delta)}}\right)^{\epsilon} \left[\mathbf{S}_{i}^{(0)}(p_{i},\delta_{i},q,\sigma) + \frac{\epsilon}{1-2\epsilon} \frac{1}{p_{i} \cdot p_{j}} \left(\frac{p_{i}^{\mu} p_{j}^{\nu} - p_{j}^{\mu} p_{i}^{\nu}}{p_{i} \cdot q} + \frac{p_{j}^{\mu} p_{j}^{\nu}}{p_{j} \cdot q}\right) F_{\mu\rho}(q,\sigma) \left(J_{i} - \mathbf{K}_{i}\right)_{\nu}^{\rho}\right]$$

Contains the tree-level soft current

$$\mathbf{S}_{i}^{(0)} = \frac{p_{i} \cdot \epsilon^{*}}{p_{i} \cdot q} + \frac{1}{p_{i} \cdot q} \left[ \left( \epsilon^{*} - \frac{p_{i} \cdot \epsilon^{*}}{p_{i} \cdot q} q \right) \cdot \delta_{i} + p_{i} \cdot \epsilon^{*} \sum_{j} \delta_{j} \cdot \partial_{j} + \frac{1}{2} F_{\mu\nu} \left( J_{i}^{\mu\nu} - \mathbf{K}_{i}^{\mu\nu} \right) \right]^{p_{1} + \delta_{1}}$$

• Constraints on differential operators - gauge invar  $J^{\mu\nu}(p) \equiv i \left( p^{\mu} \partial_{p}^{\nu} - p^{\nu} \partial_{p}^{\mu} \right), \qquad \partial_{p}^{\mu} \equiv \frac{\partial}{\partial p_{\mu}}$
